

Aircraft Guide

Data about hundreds of jets, turboprops and helicopters

AS SOON AS ITS FIRST owner departs from the manufacturer's delivery center, a new airplane technically becomes used (or preowned). For various reasons, however, 10 years after an aircraft's final production date is generally considered the milestone separating "newer" used business aircraft from "older" ones.

In deciding which aircraft to cover, we went well past this 10-year mark to provide information on all business airplanes and helicopters manufactured since 1997. This means our list includes some models manufactured before that year, as long as they were still being produced as recently as 1997. As a rule, a long production run is indicative of a successful aircraft.

We have not listed new models that, at press time, had yet to receive final certification.

GENERAL SPECS

USED PRICES

Airplane and some helicopter selling prices are based on the latest edition of the *Aircraft Bluebook Price Digest*. Additional helicopter pricing data is from helicopter appraisers HeliValues.

PASSENGER/PILOT SEATING

The typical passenger seating on the aircraft is not the maximum certified seats. These numbers may vary for different operations (corporate, commercial, EMS, etc.). Maximum number of passengers is as certified. Pilot seating is typical (i.e., two pilots may be indicated even if aircraft is single-pilot certified).

CABIN DIMENSIONS

Cabin volume is the interior volume, with headliner in place, without seats or other furnishings. Cabin width, height and length are based on a completed interior. Width and height are the maximum within that cabin space. In "cabin-class" aircraft, the length is measured from the cockpit divider to the aft pressure bulkhead (or aft cabin bulkhead, if unpressurized). For small-cabin aircraft, the distance is from the cockpit firewall to the aft bulkhead.

WEIGHTS

Max takeoff weight (mtow) is specified during aircraft certification. Fuel capacity is in gallons based on 6.7 pounds per gallon (jet fuel). Max payload with full fuel is the useful load minus the usable fuel. The useful load is based on the maximum ramp weight minus the basic operating weight.

PRODUCTION STARTED/ENDED

Year of the first delivery to the year of the last serial-number delivery.

NUMBER BUILT

Total number produced, which may include converted aircraft.

PERFORMANCE SPECS

JET AND TURBOPROP RANGE

The maximum IFR range with all passenger seats occupied, using the NBAA IFR alternate fuel reserve calculation for a 200-nm alternate.

HELICOPTER RANGE

For all helicopters, the maximum VFR range with all passenger seats occupied.

SPECIFIC RANGE

The distance an aircraft can travel for a given amount of fuel used. Based on nautical miles traveled per pound of fuel burned.

CRUISE SPEEDS

Long-range cruise speed is the speed required to achieve maximum range (best fuel economy). High-speed cruise (aka maximum cruise speed) is top speed at a gross weight corresponding to four passengers (turbine aircraft) or two passengers (piston aircraft) and half of total fuel.

SERVICE CEILING

For airplanes, this is the highest altitude at which a 100-fpm rate of climb is possible at maximum takeoff weight with all engines running. For helicopters, this is the maximum certified altitude for operation.

BALANCED FIELD LENGTH (BFL)

BFL is the distance obtained by determining the decision speed (V1) at which the takeoff distance and the accelerate-stop distance are equal (multi-engine airplanes only). BFL is based on a dry sea-level runway, no wind, NBAA IFR reserves and 86 degrees F.

LANDING DISTANCE

This is computed using the landing distance from 50 or 35 feet above the ground at sea level (depends on certification criteria) multiplied by 1.667. No credit is given for thrust reversers. Configuration is with four passengers and NBAA IFR fuel reserve on board.

HELICOPTERS
